

Item 1

I det følgende refererer $\log n$ til logaritmen med base 2, dvs. 2-tals-logaritmen. Vær opmærksom på at de sidste tre spørgsmål involverer *Big-Theta* eller *Big-Omega*, og de foregående spørgsmål involverer *Big-O*. Bemærk, i denne opgave skal du have mere end halvdelen rigtige for at opnå point.

In the following, $\log n$ refers to log base 2, i.e. the binary logarithm. Be aware that the final three sub-problems involve *Big-Theta* or *Big-Omega*, and the previous sub-problems involve *Big-O*. Note, in this assignment you must have more than half correct in order to obtain points.

	True	False
$3n^{3/2} + \log n = O(n^{2/3})$	<input type="radio"/>	<input checked="" type="radio"/>
$2(\log n)^4 = O(n^2)$	<input checked="" type="radio"/>	<input type="radio"/>
$\sqrt{n} \cdot \log n = O(n)$	<input checked="" type="radio"/>	<input type="radio"/>
$6n^{3/2} = O(8^{\log n})$	<input checked="" type="radio"/>	<input type="radio"/>
$4 \log(n^6) = O((\log n)^2)$	<input checked="" type="radio"/>	<input type="radio"/>
$2^{2 \log n} = O(\log(n!))$	<input type="radio"/>	<input checked="" type="radio"/>
$n^2 = O(n^{3/2})$	<input type="radio"/>	<input checked="" type="radio"/>
$n^{0.1} = O(n)$	<input checked="" type="radio"/>	<input type="radio"/>
$n = O(n^{1/3})$	<input type="radio"/>	<input checked="" type="radio"/>
$\sqrt{n} = \Theta(n \cdot \log n)$	<input type="radio"/>	<input checked="" type="radio"/>
$n^{2/3} = \Omega(n)$	<input type="radio"/>	<input checked="" type="radio"/>
$n^2 = \Theta(n^{0.1})$	<input type="radio"/>	<input checked="" type="radio"/>

Algorithm loop1(n)

```

 $s = 1$ 
for  $i = 1$  to  $n$ 
    for  $j = 1$  to  $i$ 
        for  $k = j$  to  $i$ 
             $s = s + 1$ 

```

Algorithm loop2(n)

```

 $i = 0$ 
 $j = n$ 
while  $i < j$ 
     $i = i + 2$ 
     $j = j + 1$ 

```

Algorithm loop3(n)

```

 $i = 1$ 
 $j = n$ 
while  $i < j$ 
     $i = 2 * i$ 
     $j = j + n$ 

```

Algorithm loop4(n)

```

 $i = n$ 
 $j = 0$ 
while  $i > 0$ 
    if  $j < i$ 
         $j = j + 1$ 
    else
         $j = 0$ 
         $i = i - 1$ 

```

Angiv udførelses-tiden for hver af ovenstående algoritmer som funktion af n i Θ -notation.

Algorithm loop1(n)

```

 $s = 1$ 
for  $i = 1$  to  $n$ 
    for  $j = 1$  to  $i$ 
        for  $k = j$  to  $i$ 
             $s = s + 1$ 

```

Algorithm loop2(n)

```

 $i = 0$ 
 $j = n$ 
while  $i < j$ 
     $i = i + 2$ 
     $j = j + 1$ 

```

Algorithm loop3(n)

```

 $i = 1$ 
 $j = n$ 
while  $i < j$ 
     $i = 2 * i$ 
     $j = j + n$ 

```

Algorithm loop4(n)

```

 $i = n$ 
 $j = 0$ 
while  $i > 0$ 
    if  $j < i$ 
         $j = j + 1$ 
    else
         $j = 0$ 
         $i = i - 1$ 

```

For each of the above algorithms, state its execution time as a function of n in Θ -notation.

	$\Theta(n^3)$	$\Theta((\log n)^2)$	$\Theta(\sqrt{n})$	$\Theta(n^2)$	$\Theta(n \log n)$	$\Theta(n\sqrt{n})$
loop1	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
loop2	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
loop3	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
loop4	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>

Den følgende kodeudsnit beregner potensen af x . Vi får to heltal, og algoritmen returnerer et heltal. Find den **mindste** Store-O tidskompleksitet for algoritmen.

```
public static long power(int x, int n)
{
    long pow = 1L;

    // loop till n become 0
    while (n > 0)
    {
        // if n is odd, multiply the result by x
        if ((n & 1) == 1) {
            pow *= x;
        }

        // divide n by 2
        n = n / 2;

        // multiply x by itself
        x = x * x;
    }
}
```

The following code snippet calculates the power of x . We are given two integers, and the algorithm returns an integer. Find the **tightest** Big-O time complexity of the algorithm.

```
public static long power(int x, int n)
{
    long pow = 1L;

    // loop till n become 0
    while (n > 0)
    {
        // if n is odd, multiply the result by x
        if ((n & 1) == 1) {
            pow *= x;
        }

        // divide n by 2
        n = n / 2;

        // multiply x by itself
        x = x * x;
    }
}
```

- 
- A $\mathcal{O}(n)$
 - B $\mathcal{O}(\log n)$
 - C $\mathcal{O}(n^2)$

D $\mathcal{O}(n \log n)$

E $\mathcal{O}(n^3)$

F $\mathcal{O}((\log n)^2)$

Item 4

a. Givet et heltalsarray af størrelse N , vil vi kontrollere, om arrayet er sorteret (enten i stigende eller faldende rækkefølge). En algoritme løser dette problem ved at foretage en enkelt gennemløb af arrayet og kun sammenligne hvert element i arrayet med dets naboer. Den værste tidskompleksitet for denne algoritme er:

a. Given an integer array of size N , we want to check if the array is sorted (in either ascending or descending order). An algorithm solves this problem by making a single pass through the array and comparing each element of the array only with its adjacent elements. The worst-case time complexity of this algorithm is

- both $O(N)$ and $\Omega(N)$ ✓
- $O(N)$ but not $\Omega(N)$
- $\Omega(N)$ but not $O(N)$
- neither $O(N)$ nor $\Omega(N)$

b. Overvej følgende tre funktioner:

$$f_1 = 10^n, \quad f_2 = n^{\log n}, \quad f_3 = n^{\sqrt{n}}$$

Hvilken af følgende muligheder arrangerer funktionerne i stigende rækkefølge af asymptotisk vækstrate (fx er $\log n, n, n^2$ arrangeret i stigende rækkefølge af asymptotisk vækstrate)?

b. Consider the following three functions:

$$f_1 = 10^n, \quad f_2 = n^{\log n}, \quad f_3 = n^{\sqrt{n}}$$

Which one of the following options arranges the functions in the **increasing** order of asymptotic growth rate (e.g. $\log n, n, n^2$ ordered in the increasing order of asymptotic growth rate)?

- f_3, f_2, f_1
- f_2, f_1, f_3
- f_1, f_2, f_3
- f_2, f_3, f_1 ✓
